## C. G. PURDY

EXERCISING DEVICE

Filed March 29, 1921

## UNITED STATES PATENT OFFICE.

CHARLES G. PURDY, OF BROOKLYN, NEW YORK.

EXERCISING DEVICE.

Application filed March 29, 1921. Serial No. 456,616.

To all whom it may concern:

Be it known that I, CHARLES G. PURDY, a citizen of the United States, and a resident of the city of New York, borough of Brooklyn, in the county of Kings and State of New York, have invented a new and Improved Exercising Device, of which the following is a full, clear, and exact description.

The present invention relates to new and 10 useful improvements in exercising devices, and it pertains more particularly to devices especially designed and constructed for exercising the teeth, gums and all other organs which under a natural diet would receive their exercise through the act of mas-

tication.

It is well known that modern methods of preparing food usually result in a cooked food requiring little or no mastication. The 20 use of such foods results in decayed teeth, undeveloped jaws, and various other complications due solely to the lack of exercise attendant on proper mastication.

It is the primary object of the invention to 25 provide a device the use of which will supply the necessary exercise to the muscles of these several organs to keep said organs in a healthy state, and operate as a preventative agent and curative medicine in case of

pyorrhea.

It is a still further object of the invention to provide a device of this character which is capable of use in different forms dependent upon existing conditions.

With the above and other objects in view, reference is had to the accompanying draw-

ings, in which

Figure 1 is a plan view of the mouthpiece of a device constructed in accordance with 40 the present invention; Fig. 2 is a sectional view thereof taken on

the line 2-2 of Fig. 1;

the methods of use of the device;

method of use of the device.

Referring more particularly to the drawings, the device comprises a plate 5 so shaped as to conform to the general contour 50 of the mouth. This plate is prepared in such a manner that it will have the bite of the person for whom the plate is made, said plate being formed with depressions adapted to receive the teeth in such a manner that 55 each tooth will be in contact therewith during the operation of gripping the plate be-

tween the teeth. The plate 5 may be formed of either rigid material or pliable material as desired, and the same is reinforced by means of a wire or the like 6, extending 60 through the body substantially centrally thereof. As more clearly shown in Fig. 1, this reinforcing element is projected beyond the front portion of the plate to form an eye 7. Attached to the eye 7 is a cord or 65 other suitable flexible member 8, and said cord or the like has a spring or similar element 9 secured to its other end. In lieu of this construction, however, it is obvious that a rigid handle may be attached to the de- 70 vice, if desired.

The device is used in the following man-

The plate is gripped between the teeth of the user and the spring or flexible member 75 8 is attached to a wall or other suitable support. When the device has been secured to the support and the plate firmly gripped between the teeth, by movements of the head, the device will receive a series of 80 short jerks or impulses which will be transmitted to the teeth in order to produce a strain thereon, which strain serves to give the several organs of the mouth and head a proper exercise to maintain the necessary 85 circulation therein.

In Fig. 4 is shown another method of using the device and when used in this manner, two plates 5 are employed. Each of these plates is provided with a flexible mem- 90 ber 8, the ends of which are secured to a single elastic member 9 in the form of a spring or the like. This form of the device is used by two persons, each of which grips one of the plates between the teeth, and 95 said persons pull in opposite directions similar to the so-called "tug-of-war."

From the foregoing it is apparent that Fig. 3 is a schematic view showing one of the methods of use of the device;

Fig. 4 is a similar view showing another

From the foregoing it is apparent that the present invention provides means by which the teeth, gums and other organs of 100 the mouth are subjected to sufficient exercise to set up a free circulation therein and

maintain a healthy state thereof.

I claim:

1. A device for exercising the teeth com- 105 prising a plate adapted to correspond with the articulation of the user, and means connected with the plate for exerting traction on said plate whereby the teeth are positively exercised, as and for the purpose set 110 forth.

2. A device for exercising the teeth com-

for reinforcing said plate, said reinforcing means projecting from said plate in the form of an eye, and traction-producing means secured to said eye.

3. A device for exercising the teeth comprising a plate formed to conform to the articulation of the user, and traction-producing means adapted to be attached to said 10 plate, said traction-producing means comprising a pliable elastic member.

4. As a new article of manufacture, a de-

prising a plate of suitable material, means vice for exercising the teeth, comprising a plate shaped to conform to the contour of the mouth and having on each side com- 15 paratively deep depressions to receive the teeth, said depressions corresponding in number to the teeth of the user so that each tooth will be seated in a depression, the plate being provided with a member 20 projecting from its front portion whereby when traction is exerted upon said member, each individual tooth will be exercised. CHARLES G. PURDY.
